

ABSTRACT

1 Assemblage method of an auxiliary handle apparatus upon a driver-device having a handle
2 with shank extending perpendicularly from the handle, the apparatus assembled location fixed
3 upon the shank, and comprising separate shaped halves, one discrete half held by, guided to against
4 work by, serving to position-rotatable-about-the-shank one hand-portion of a user/operator's hand
5 which positioned, positions a second portion of the hand free to orbit, grasp, hold, and release the
6 apparatus's other half, the hand's second portion, as positioned, used for improving ratcheting,
7 spinning the other half-apparatus spinning the shank, and acting as clutch releasing-the-other-half-
8 apparatus-to-move-easily-within-the-grasp enhancing an alternating two handed continuous spin of
9 the shank. The apparatus having halves shaped and located, offers as platform to support
10 installation of means stepping up and or equalizing ability of one hand, gripping from positioned
11 along side the driver, to spin driver's shank, together with ability of another hand spinning shank
12 from positioned gripping on driver's rear. The apparatus comprises a slip-ring-type-hand-held-
13 guide half, assembled girdling the driver's shank loosely thereby discretely independently, freely-
14 able-to-be-spun unlimited in direction relative the shank as axis; and a hand-operated-drive-wheel,
15 other apparatus half, mounted separately juxtaposed- adjacent in line rearward the guide, forward
16 of the driver's-handle, and girdling while engaging the shank, thereby the shank is spun with the
17 wheel's spin but the guide spins discretely.
